RapidEye Constellation Supports Environmental Applications in LULUCF and REDD Projects

This presentation will demonstrate the use of RapidEye imagery to support land use, land use change, and forest monitoring applications. The primary example is the MAD-MEX system. This is a partnership between BlackBridge and CONABIO to make a system available for other countries to use as a tool to process Landsat and RapidEye images for vegetation mapping. Through this presentation, the audience will come to understand how to use BlackBridge solutions for environmental projects.
